

The background of the slide features a dark blue to purple gradient with faint, glowing circular patterns and a scale-like graphic on the left side. The scale has numerical markings from 150 to 260 in increments of 10. The main title is centered in white, uppercase letters.

TAKING THE MYSTERY OUT OF ORAL MEDICATIONS

BRAD SUTTON, OD, FAAO
CLINICAL PROFESSOR
INDIANA UNIVERSITY SCHOOL OF OPTOMETRY

The background of the slide is consistent with the first slide, featuring a dark blue to purple gradient with faint, glowing circular patterns and a scale-like graphic on the right side. The scale has numerical markings from 80 to 200 in increments of 20. The main title is centered in white, uppercase letters.

FINANCIAL DISCLOSURES

- No financial disclosures
- brsutton@indiana.edu

CATEGORIES

- I) ANTIBIOTICS
- II) ANTIVIRALS
- III) PAIN RELIEF
- IV) STEROIDS

ORAL ANTIBIOTICS: OCULAR INDICATIONS

- Beat the bugs!
- Rosacea / Ocular Rosacea
- Dacryoadenitis
- Dacryocystitis
- Preseptal Cellulitis
- Hordeola / Chalazia
- Blowout Fractures

COST

- \$4 (30 day) and \$10 (90 day) lists for generics at many pharmacies
- Indicated by an *

CEPHALEXIN *

- 250 or 500 mg (QID or BID)
- Excellent broad-spectrum cephalosporin
- Bactericidal
- Cross sensitivity with penicillin regarding allergies but not with everyone. Only about 10%
- Keflex brand is very expensive!
- Up to 40% failure rate with facial cellulitis due to resistance

DICLOXACILLIN

- Penicillinase resistant penicillin
- Great for soft tissue infections
- Bactericidal
- Nausea, allergies, diarrhea
- 250 mg QID or 500 mg BID
- Inexpensive

AUGMENTIN

- Amoxicillin plus clavulanate: 250 ,500 mg TID or 875mg BID
- Works on bugs that are resistant to penicillin due to penicillinase
- Bactericidal, good coverage, allergies
- 500mg available generically, but more expensive than dicloxacillin

TETRACYCLINE*

- 250 or 500 mg QID
- Bacteriostatic with much resistance
- Poor for soft tissue disease
- Can not be used in pregnant women or children due to effect on bone and enamel formation (discoloration of teeth)
- Makes BC Pill less effective. Yeast infections.
- Photosensitivity, stomach upset, calcium inactivation (take on empty stomach)
- Great lipid / acid modulating effects

DOXYCYCLINE

- 50 or 100 mg, often BID at first
- Periostat: 20mg (mostly dental use)
- In tetracycline family
- Can take with food
- Less problems with photosensitivity
- Still get stomach upset (don't lie flat for 30 minutes)
- As effective as tetracycline but fewer side effects, better dosing.
- Oracea (30 /10) \$\$\$\$\$\$\$\$\$\$\$\$ (very expensive)
- Doxy used to be inexpensive, but no longer. Removed from \$4 / \$10 plans
- Can also use minocycline

MINOCYCLINE

- 50 or 100 mg BID
- Similar side effect profile to others, but also blue / black discoloration of skin, nails, and sclera with long term use.
- Often used for acne
- Relatively high rate of increased ICP (intracranial pressure)

AZITHROMYCIN

- Zithromax Z-pack: 6, 250 mg capsules. Is a macrolide. Moderate price but good for compliance
- Take 500 mg (2) the first day and one 250 mg tablet each of the next 4 days
- Can also take a single, 1000 mg dose (for ocular chlamydia for example). Powder pack
- May enhance the effect of oral anticoagulants
- 2 X risk of sudden cardiac death in heart patients

AZITHROMYCIN

- Now has FDA warning for fatal arrhythmia
- Greater risk if prolonged QT interval, bradycardia, hypomagnesia
- Many experts calling for ban due to resistance concerns. Long half life and broad spectrum contribute majorly to overall resistance.
- Can be as effective in treating rosacea / MGD / chalazia as the tetracycline / doxycycline family of drugs

ERYTHROMYCIN*

- Ery-tab sustained release tablets 250, 333, or 500 mg. Dose is 1000 mg (1 gram) per day so dose according to tablet
- Can use safely when tetracycline family can not be used (children, etc.)
- Bacteriostatic and terrible stomach upset
- Does not have the lipid / acid modulating properties of the tetracyclines
- Very rarely a first choice

ERYTHROMYCIN

- Increased risk of sudden cardiac death
- Two-fold increase of very low risk when taken alone
- Five-fold increase when taken with the following drugs.....
Diltiazim, Fluconazole, Itraconazole, Ketaconazole, Verapamil
- These drugs slow the breakdown of E-mycin resulting in increased concentration which in turn increases cellular sodium levels in resting heart muscle cells triggering an arrhythmia

BACTRIM

- Trimethoprim and Sulfamethoxazole: one tablet contains 80 mg T and 400 mg S (also available in double strength).
One double-strength tablet Q12h
- Can not use if patient has sulfa allergy
- Good against MRSA and toxoplasmosis (DS)

CIPROFLOXACIN*

- Fluoroquinolone: 750 / 500 / 250 BID
- 5mg/100ml suspension
- Effective but overused so resistance an issue.
- Should not use in patients under 18 due to joint / tendon problems
- Possible increased risk of RD has been refuted for the most part
- FDA now says oral Fluoroquinolones should never be first line choice due to potential SE's

ORAL FLUOROQUINOLONES

- Significant side effects.....
 - Peripheral neuropathy
 - Tendon rupture
 - Heart arrhythmia
 - Dysglycemia in diabetics
 - Possibly GI perforation

ORAL ANTIVIRALS

- Used to manage Herpes Simplex and Herpes Zoster

ORAL ANTIVIRALS-DOSING SIMPLEX

- Acyclovir (200*,400,800) : typically 800mg TID, varies
- Prophylactic dosing 400mg BID
- Also available in a pediatric suspension
- 200 mg available on \$4 / \$10 plans, but only allocated one 200 mg tablet per day, so problematic
- Famvir (125,250,500)
- 500mg TID
- Valtrex (500,1000)
- 500 mg TID
- Better bio-availability than Acyclovir

ORAL ANTIVIRALS-DOSING ZOSTER

- Acyclovir: 800mg 5X day for 10 days
- Famvir: 500mg TID x 1week (may be antiviral of choice with zoster: can kill latent virus particles)
- Valtrex: 1000 mg TID X 1 week

SIDE EFFECTS OF ANTIVIRALS

- Very safe
- Significant caution with renal impairment: only true contraindication other than allergy
- Headache
- GI upset / abdominal pain
- Hallucinations in elderly patients

H.E.D.S. (HERPETIC EYE DISEASE STUDY) - FINDINGS

- Prophylactic 400 mg of oral Acyclovir (Famvir / Valtrex not studied) twice per day for one year resulted in a 45% decrease in the rate of recurrence for all forms of ocular complications
- Over the six months after discontinuation, there was no rebound increase but no continued benefit, so have to keep taking it
- Interestingly, the benefit mostly applied to those with previous stromal disease, not previous dendrites alone in this study

MORE RECENT STUDY

- Olmstead County, Minnesota (394 patients)
- Those NOT taking prophylactic antivirals were.....
- 9.4 X more likely to have epithelial recurrence
- 8.4 X more likely to have stromal rec.
- 34.5 X more likely to have lid / conj. rec.

PROPHYLAXIS

- So.....
- At least discuss prophylaxis for all patients with stromal disease and patients with multiple attacks of epithelial disease
- Acyclovir 400mg PO BID
- Very safe, caution in severe kidney disease, monitor creatine and BUN

PROPHYLAXIS

However: Report in Journal of Infectious Disease 2013:208 (November) 1359-1365 and an editorial in the same issue.....

- Are we creating Acyclovir resistant strains of HSV with prophylactic use?
- In cases using Acyclovir for ocular prophylaxis, 26% showed ACV resistance. So we must consider this

ORAL PAIN MEDICATIONS

- Manage underlying condition appropriately first from an ocular standpoint
- Topical/ocular pain control.....
- Cycloplegia
- NSAIDS
- Steroids
- Bandage CL
- Topical anesthetic in office only

PAIN MEDICATIONS

- If topical management is not enough, then consider oral pain relief
- Laws vary for OD's regarding use of controlled substances
- Two broad categories...
- OTC pain relief, mostly NSAID's
- Narcotic pain relief

COMPARISON OF ANALGESICS

Image from cvm.msu.edu/.../Pain%20Management%20PDA.htm

NSAIDS

- OTC NSAID's are often enough to mitigate ocular pain
- Aspirin, Ibuprofen, APAP, naproxen
- Common Trade names aspirin, Advil, Tylenol, Aleve
- Aspirin 81mg, 325-500mg
- Advil 200mg
- Tylenol 325-500mg
- Aleve 220mg

RX NSAIDS

- Indomethacin (Indocin) 25, 50 mg
- Naproxen (Anaprox) 275, 550 mg
- Ibuprofen (Motrin) 200-800 mg
- Indomethacin very good for scleritis. TID dosing

COMMON NSAID CONCERNS

- GI upset (take with food or drink, don't lie down for 30 minutes)
- Bleeding
- Ulcers
- Caution also with renal disease, heart disease, liver disease (mostly APAP)
- Rx strength particularly problematic with heart disease

TRAMADOL (ULTRAM): USED TO BE NON-NARCOTIC, BUT NOW A CONTROLLED SUBSTANCE

- Immediate release (50-100 mg) and extended release (100-300 mg) versions
- Maximum dose 300mg /day
- Dose q 6-8 h
- Schedule IV, so limited (but possible) abuse potential

NARCOTIC PAIN RELIEF

- As an OD, may or may not have authority to use (only Tramadol in Indiana for example)
- Standard warnings.....no alcohol, don't operate machinery

NARCOTIC SIDE EFFECTS

- Constipation very common, and can be severe
- Nausea and vomiting: often ceases after first few doses
- Sedation
- Lack of mental clarity
- Respiratory depression (most severe)

NARCOTIC PAIN RELIEF

- DEA Scheduled substances
- I-V
- Schedule one has high abuse potential, schedule 5 very limited abuse potential
- Two types of dependence....
- Psychological and physical
- Physical usually requires 2 weeks of therapy or more

OXYCODONE

- Schedule II :high abuse potential with severe dependence risk
- Percocet: 5mg with 325 mg of APAP
- Percodan:4.5mg with 325 of APAP
- Tylox: 5mg with 500mg of APAP

HYDROCODONE

- Schedule II now
- Lortab: 2.5,5,7.5 mg with 500mg APAP
- Vicodin: 5mg with 500mg APAP
- Vicodin ES: 7.5MG with 500mg APAP
- Norco: 5,7.5,10 with 325 APAP
- Zohydro ER: 10,15,20,30,40,50

CODEINE

- Schedule III
- Tylenol with Codeine, all have 300mg of APAP
- Tylenol #2 : 15mg
- Tylenol #3 : 30mg
- Tylenol # 4 : 60 mg

ORAL STEROIDS

- When oral steroids are used appropriately for a relatively short time they are very, very safe
- After all, they are basically a natural substance already found in the body
- Be aware of body weight when dosing

WHO DOESN'T GET ORALS, OR GETS THEM VERY, VERY CAREFULLY

- Diabetics
- Patients with stomach problems / ulcers
- Patients with active infection
- Pregnant women

WHAT CAN THEY DO THAT'S BAD?

- Almost nothing in the short term! Most issues require long term use
- Increase Na^+ , decreased K^+ leading to fluid retention
- Hypertension
- Elevate blood glucose levels
- Stomach pain and ulcers (stomach upset with short term use)
- Insomnia, euphoria, psychosis (possible with short term use)
- Thin skin / bruising
- Osteoporosis
- Increased ICP
- PSC's (far more commonly than topicals)
- Increased IOP (far less commonly than topicals)

WHAT CAN THEY INTERACT WITH?

- Screw up glucose control
- ASA, Coumadin
- Digoxin
- Some antibiotics, anti-seizure meds, anti-TB meds (TB itself is a strong relative contraindication)

WHAT DO THEY DO THAT'S GOOD?

- Duh!.....they decrease inflammation and therefore inflammatory sequelae

WHAT CAN WE USE ORAL STEROIDS FOR IN EYE CARE?

- Contact dermatitis / allergic response of the eye lids
- Reaction to insect bite or sting on the eye lids
- Recalcitrant CME
- Recalcitrant uveitis, especially bilateral or vitritis
- Choroiditis / retinitis
- Scleritis

USES OF ORALS IN EYE CARE

- Myasthenia Gravis
- Inflammatory orbital pseudotumor
- Thyroid eye disease / Grave's ophthalmopathy
- Optic neuritis (but not by themselves!)
- GCA
- DLK post LASIK (in conjunction with topicals)

OCULAR SIDE EFFECTS OF ORAL STEROIDS

- These are well known.....PSC's and increased IOP
- IOP increases are rare, but can occur with very long-term use
- PSC's are not rare!
- 10 mg per day or less for one year or less has almost no chance of PSC formation
- 16 mg per day or more over several years has a 75% chance of PSC formation
- Overall, general population has a .5% chance of PSC development while those on long term oral steroids have a 30% prevalence (across doses)

ORAL STEROIDS

- Oral steroids are generally prescribed in one of two ways.....
- 1) Medrol dose pack (methylprednisolone)
- 2) Prednisone 10mg tablets

COMPARISONS

- When it comes to suppressing the HPA (hypothalamic-pituitary-adrenal) axis.....
- 25mg Cortisone = 20mg Hydrocortisone = 5mg Prednisone = 4mg Triamcinolone = 4mg Methylprednisone = .75mg Dexamethasone
- Potency essentially follows this order but in reverse
- Body produces an amount of cortisone that equals 5mg of prednisone per day

MEDROL DOSE PACK

- Available in different strengths
- Most commonly used is a package of 21, 4 mg tablets(2 mg is available)
- Six are taken the first day, then one less each day thereafter (6-5-4-3-2-1 = 21 tablets)
- Self tapering and little to no suppression of the HPA axis
- In eye care, really only strong enough and long lasting enough for treatment of lid reactions

PREDNISONE*

- Most common dosing is to give the desired amount in 10 mg tablets (need 40 mg, take 4 pills)
- Is available in 1, 2.5, 5, 10, 20, and 50 mg tablets
- Best choice for most of our desired uses in eye care
- Potent and flexible

DOSING

- Up to 60 mg, take entire dose in the morning
- Over this amount take $\frac{1}{2}$ in morning, $\frac{1}{2}$ in evening
- As previously mentioned, Medrol dose pack self tapers
- With prednisone, after relatively short course at full desired strength, taper by ten milligrams every other day

DOSING

- An alternative approach is to give twice the desired dose every other day then don't taper. Only for short term use, not long term
- Theory is that anti-inflammatory properties remain high but suppression of HPA axis is much, much less
- For long term use taper must be very slow
- As OD's we rarely would be involved in the long term prescription of oral steroids

THE END!

- Questions?
